

Project Proposal

Food Registration System

Scenario: A customer will be able to place orders of food items, which the admin will process and allow the driver to take the order. He will then deliver said order to the customer.

Functionalities: The customer would be able search, order, and pay an order. In addition, the customer will be able to input codes to reduce price (1 valid at a time), and be able to make a combo meal to reduce price too. Admin will process items into a list and change the status. Then, the driver would take the top order in the queue, which would he would then deliver changing the status of the order to delivered.

Expected Output: Customer should be able to check queued orders. When delivered, said list should be cleared or put into a different list. The driver should have also a list of previous orders done.
